**INTRODUCTION**

Richard Milton is a science journalist from Great Britain. He is a very controversial author because of his candid approach to scientific topics. *Shattering the Myths of Darwinism* takes this very candid approach to the field of evolutionary biology. Surprisingly, Milton defies the dogmatic approach Darwinists take to the theory of evolution by natural selection. Richard Dawkins, the author of *The Blind Watchmaker*, described Milton as a “fruitcake in need of psychiatric help.” Milton is not afraid to publish his thoughts from the angle of someone who isn’t interested in following the crowds towards the evolutionary mecca that is Darwinism.

**OVERVIEW**

Milton believes the earth to be much younger than what Darwinists believe. To support this Milton suggests, due to the amount of helium in the atmosphere, that the earth is not even 200,000 years old. To further support a young earth, he gives clear-cut evidence proving the fallacy of rock dating from a strictly scientific perspective. Anyone who wants to know exactly how Darwinists bend the data of the age of rocks to support their evolutionary theory should read this book. Milton further denounces experiments supposedly showing that anything can happen by chance. In fact, he concludes that these experiments actually prove special creation with the experimenter taking on the omnipotent role. After reading this book it is clear that spontaneous bio-regeneration is impossible and that the origin of species could not have been a result of evolution due in part to the abundance of missing links and the tale of the rock layers. The subject is also broached of the faithful reproduction of outdated, and falsified information in biology textbooks.

**ASSESSMENT**

Milton comes to all of his conclusions based on an unbiased review of actual data taken now from many years of research. It is refreshing to hear an intelligent, reputable science correspondent present the facts with no agenda. Milton is not swayed by the steamroller tactics of Darwinists. In fact, he presents them as more like religious ideologists than scientists. Milton is not a Christian. He would still not go so far as to say that God created everything by special design, though he admits all the information leads this way. He is more of an agnostic with inclinations towards alternative explanations through new experimentation.

**CONCLUSION**

Anyone who likes to read a book containing concrete facts displayed in a riveting straightforward manner then this book would not disappoint. Many Christians would say that Darwinism is a cult movement followed blindly by faithful advocates. This book definitively proves it from a relatively unbiased perspective. It is sad that someone could look objectively at the information and not be willing to subsequently come to a subjective conclusion. May God lead Mr. Milton and others like him to take the step towards special creation and believe in our Special Creator.
